PROBLEM:

ANS =

For each short question, pick a correct frequency and enter its letter in the answer box. Note: Some questions might have more than one answer.

(a) If the output from an ideal C/D converter is x[n] = (a) 8 1000 cos(0.25 πn), and the sampling rate is 8000 samples/sec, then determine one possible value of the input frequency of x(t): (b) 4

$$x(t) \qquad \begin{array}{c|c} \text{Ideal} & x[n] \\ \hline C \text{-to-D} \\ \hline C \text{onverter} \end{array} \qquad (c) 2000 \text{ Hz} \\ \hline (d) 1600 \text{ Hz} \\ \hline T_s = 1/f_s \qquad (e) 1200 \text{ Hz} \end{array}$$

(b) If the output from an ideal C/D converter is $x[n] = 1000 \cos(0.25\pi n)$, and the input signal x(t) defined by: $x(t) = 1000 \cos(1800\pi t)$ then determine one possible value of the sampling frequency of the C-to-D converter:

(g) 800 Hz

(f) 1000 Hz

$$\begin{array}{c|c} x(t) & \text{Ideal} & x[n] \\ \hline C \text{-to-D} & \hline \\ C \text{onverter} & \hline \\ T_s = 1/f_s \end{array}$$
(i) 400 Hz

(c) Determine the Nyquist rate for sampling the signal x(t) defined by: $x(t) = \Re e\{e^{j4000\pi t} + e^{j3000\pi t}\}$.

ANS =

Frequency

- (a) 8000 Hz
- (b) 4000 Hz
