## **PROBLEM:**

Define x(t) as

$$x(t) = 2\cos(5\pi(t - .6)) + \sqrt{2}\cos(5\pi t + \pi/4)$$

- (a) Use phasor addition to express x(t) in the form  $x(t) = A \cos(\omega_0 t + \phi)$  by finding the numerical values of *A* and  $\phi$ , as well as  $\omega_0$ .
- (b) Make two complex plane plots to illustrate how complex amplitudes (phasors) were used to solve part (a). On the first plot, show the two complex amplitudes being added; on the second plot, show your solution as a vector and the addition of the two complex amplitudes as vectors (head-to-tail).

## Two vectors here.
