PROBLEM:

Evaluate the "running" average:

$$y[n] = \frac{1}{L} \sum_{k=0}^{L-1} x[n-k]$$

for a specific input signal—a signal that turns on at n = 0. This is called the *unit step* signal, and is usually denoted by u[n].

$$x[n] = u[n] = \begin{cases} 0 & \text{for } n < 0\\ 1 & \text{for } n \ge 0 \end{cases}$$

(a) Make a plot of u[n] before working out the answer for y[n].

- (b) Now compute the numerical values of y[n] over the range $-5 \le n \le 10$, assuming that L = 5.
- (c) Make a sketch of the output for both over the range $-5 \le n \le 10$, assuming that L = 5. Use MATLAB if necessary, but learn to do it by hand also.
- (d) Finally, derive a general formula for y[n] that will apply for any length L and for the index range $n \ge 0$.
